## TWO UNUSUAL SPIDERS

by FRANCES MURPHY.

### Hybocoptus decollatus (Simon) in Surrey.

Two males of this species were knocked out of a yew tree at White-down, Surrey (TQ 14) on 21.5.67. This species was originally found in the Isle of Wight and has more recently been taken in Dorset, Wiltshire and Sussex (B.S.S.G. Bulletin No.25, p.7).

### Centromerus incilium (L.Koch) in Middlesex.

Hatherop Recreation Ground, Hampton (TQ 17) borders on Kempton Park Reservoir. A high wire fence with concrete posts divides them. A female of C. incilium was grubbed from the long grass around these posts together with two common spiders, Centromerita bicolor (Blk.) and Maso sundevalli (Westr.), on 14.10.67.

C. incilium has previously been found near Balmoral at Frilford Heath in March and April 1952, and in Hampshire (B.S.S.G. Bulletin No.26, p.5). My thanks are due to Dr. J.A.L. Cooke for checking this identification.
